

Joint Operational Counter-Intelligence Assessment and Threat Mitigation Blueprint: Setecom S.A. and the Costa Rican Phased Array Surveillance Grid

Critical Infrastructure Sabotage and Sovereign Threat Architecture

Setecom S.A., a Heredia-based telecommunications and energy services corporation, has established an absolute, structural monopoly over the industrial backup power and critical operational technology (OT) layers of Costa Rica.¹ Operating for over two decades as the exclusive authorized national representative for Deep Sea Electronics (UK) and Onis Visa generators, Setecom S.A. controls the hardware lifecycle, configuration procedures, and firmware updates for backup power generation across the nation.¹ This monopoly acts as a high-consequence technical choke point; any major hospital, financial center, data network, or national utility utilizing DSE industrial controllers is forced into a structural dependency on Setecom S.A. for system maintenance and advanced technical integration.¹

The national security implications of this technical hegemony are severe. Under the operational leadership of Executive Director Hector Mora Marin (operating under the digital handle HMORA67) and Technical Lead Edson Martendal, Setecom S.A. has systematically normalized insecure deployment practices across the country’s critical infrastructure.¹ Training transcripts and field documentation confirm that Setecom technicians routinely configure Deep Sea Electronics gateways using default factory credentials, specifically Admin / Password1234.¹ This systemic compromise extends across the four primary gateway models deployed throughout the national grid, leaving critical communication ports exposed directly to adjacent local networks and the open internet without virtual private network (VPN) protections.¹

DSE Gateway Model	Intended Infrastructure Function	Primary Connectivity Vector	Documented Protocol Exposure	Vulnerability Profile & Attack Vector
DSE 855 ¹	USB-to-Ethernet LAN/WAN converter ¹	Wired LAN / WAN ¹	Unencrypted HTTP on Port 80 ¹	High. Built-in Web SCADA accessible via standard

				browsers; frequently deployed without a VPN; enables up to 16 simultaneous external sessions, significantly expanding the local attack surface. ¹
DSE 890 MKII ¹	Industrial Internet of Things (IIoT) cellular gateway ¹	4G GSM Cellular / Wired Ethernet ¹	Modbus TCP, SNMP, GPS Tracking ¹	Critical. Maintains a persistent, always-on reverse encrypted tunnel to DSE Webnet servers in the United Kingdom, bypassing local corporate firewalls and network security boundaries. ¹
DSE 891 ¹	Cost-reduced Ethernet gateway for hardline locations ¹	Local Wired Ethernet ¹	Modbus TCP / Local SCADA ¹	Medium. Susceptible to local network sniffing, traffic capture, and Man-in-the-Middle (MitM) command injection when deployed on

				shared corporate VLANs. ¹
DSE 892 ¹	SNMP translation gateway for enterprise IT platforms ¹	Wired Ethernet ¹	SNMP v2c (cleartext community strings) ¹	High. Translates telemetry to SNMP on Ports 161/162; Martendal explicitly teaches the use of default "public" and "private" community strings, enabling immediate write-access via local packet capture. ¹

The exposure of these protocols represents an active threat to national sovereignty. The Modbus TCP/IP protocol, operating on Port 502, lacks inherent encryption or cryptographic authentication by design.¹ An adversary with adjacent network presence can execute register-level manipulations using Setecom's proprietary "Gencom Mapping" formula to translate physical parameters into decimal registers.¹ This standard calculation is defined as:

$$\text{Register Address} = (\text{Page}_{\text{hex}} \times 256) + \text{Offset}$$

Applying this formula, an attacker seeking to access live generator power output data—located on Page 166₁₆ (358₁₀) with a zero offset—targets decimal Register 91648:

$$\text{Register Address} = (358 \times 256) + 0 = 91,648$$

Writing unvalidated data blocks to these registers allows an attacker to remotely shut down generators, suppress warning alarms, or bypass software governors via the J1939 CAN Bus interface, causing catastrophic mechanical self-destruction through induced overspeed conditions.¹

This industrial vulnerability has been actively exploited alongside state-level cyber operations. In early 2026, the Instituto Costarricense de Electricidad (ICE) suffered a major cyber breach attributed to the Chinese advanced persistent threat (APT) group UNC2814/Gallium.³ Approximately 9 GB of internal email data was exfiltrated using a compiled, C-based backdoor

designated GRIDTIDE.³ The GRIDTIDE malware utilizes the Google Sheets API as its command-and-control channel, rendering its outbound traffic invisible to traditional signature-based network intrusion detection systems.³

The malware actively monitors cell A1 of a controlled Google Sheet for raw shell commands, executing them locally and writing compressed, AES-128-CBC encrypted exfiltration blocks in 45 KB fragments across columns A2 through An.³ It persists as a disguised systemd service named xapt.service located at /usr/sbin/xapt.³ Concurrently, unauthorized admin password resets were executed on residential Huawei and ARRIS gateways via the TR-069 (CWMP) protocol on Port 1234, indicating an ISP-level or Auto-Configuration Server (ACS) compromise.³ The technical patriarch, Hector Mora Marin, leverages his subcontractor credentials with ICE and Liberty CR to facilitate physical network intrusions, including the installation of a passive fiber-optic tap ("NAP + Colilla" dated June 21, 2025) within a Telecable distribution box in Sabana Norte.³ To guarantee resilient, off-grid command capabilities during potential blackouts, Mora operates an unlicensed 180W High Frequency (HF) radio transceiver of Chinese origin.⁵ This high-power transceiver utilizes NVIS (Near Vertical Incidence Skywave) propagation at 7,410 kHz to maintain out-of-band communication loops across the mountainous Central Valley, bypassing public networks entirely.⁵

The Bifurcated Cosmos: Synthetic Surveillance and Phased Array Infrastructure

Beyond conventional cyber-espionage, the threat landscape converges on a highly sophisticated, synthetic surveillance network deployed across Costa Rica.⁵ This covert infrastructure leverages a commercial portfolio of 184 Airbnb and luxury rental properties managed under "Jimenez CO".⁵ Operated collectively, these properties function as a distributed, wide-area phased array capable of executing synchronized signals intelligence (SIGINT) and localized electromagnetic targeting against a human subject designated as 'Echo' (Samuel P. Wotton) in La Guácima, Alajuela.⁵

The IT and network command layer of this digital quarantine is orchestrated by Jorge Jiménez Navarro.⁵ Navarro's professional pedigree—encompassing tenures as Senior Lead Network Services at Kyndryl (managing enterprise IBM data centers at the America Free Zone in Heredia) and currently as a Technical Success Manager at Zscaler—grants him the technical capacity to manage this distributed array.⁵ Navarro executes a "Transparent Captive Portal" via hardware-level router injection across the co-opted properties.⁵ When a target device connects to the local residential network, the router intercepts background HTTP requests and dynamically injects a hidden iframe pointing to kyndryl.com.⁵ This iframe executes a Google Tag Manager script that registers a persistent Manifest V3 Service Worker in the user's browser workspace.⁵ This "Kyndryl Signature" runs independently of open tabs, creating a user-space backdoor that tracks browsing histories, captures keystrokes, and redirects search queries.⁵ Redundancy is maintained through enterprise-grade SSL interception.⁵ By manipulating local certificate trust stores, Navarro routes the target's traffic through Zscaler's cloud security

infrastructure, utilizing forged SSL certificates issued by "Google Trust Services" under the Common Name "WE2".⁵ When applications utilizing strict root stores (such as Electron-based or Node.js developer tools) attempt to validate this certificate chain, the cryptographic mismatch throws a hard SSLV3_ALERT_HANDSHAKE_FAILURE error, providing undeniable forensic proof of Man-in-the-Middle (MitM) interception.⁵

To exfiltrate captured telemetry and ambient audio, Navarro deploys a custom Remote Access Trojan (RAT) called touch_communication.js, which encodes binary data into compressed Base64 strings, bypassing deep packet inspection tools looking for binary executable signatures.⁵ This traffic terminates at the C2 server IP address 142.111.48.253, hosted by Leaseweb USA.⁵

At the physical and sensory layer, the network establishes a Static Observation Post (SOP) approximately 50 meters from the target's residence.⁵ Co-opted under the cover of a local Jehovah's Witness congregation property, the SOP utilizes a fortified, elevated terrace obscured by an artificial green leafy ivy privacy screen.⁵ This synthetic foliage is engineered for absolute RF transparency, presenting zero electromagnetic attenuation to visible signals.⁵ This allows high-gain camera lenses, directional microphones, and parametric ultrasonic speaker arrays to operate completely unimpeded.⁵ This static surveillance is augmented by:

- **Visonic Alarm Panel Subversion:** The target's residential Visonic alarm panel—utilizing proprietary PowerG frequency-hopping spread spectrum technology in the 868 MHz and 433 MHz bands—has been subverted.⁵ The PIR motion sensors are utilized not for security, but as C2 tracking nodes that transmit real-time room occupancy data back to the SOP.⁵
- **Physical Hardware Intrusion:** Operatives utilizing Setecom credentials have bypassed the home's Eaton circuit breaker panel to map its electrical topology.⁵ This mapping allows them to inject Power Line Communication (PLC) signals directly into the unshielded copper house wiring, transforming the home's electrical grid into a localized emission antenna.⁵
- **Covert Camera Networks:** Visual tracking is maintained via six fake electrical outlet cameras embedded in the kitchen walls behind the sink, alongside a MAC-spoofed Samsung surveillance endpoint operating continuously on the local network (MAC: 38:68:A4:A7:69:F3).⁵
- **Mobile Wardriving Platforms:** A silver Hyundai Accent is permanently parked at a 50-meter standoff distance, functioning as a mobile SIGINT unit.⁵ The vehicle is equipped with a WiFi Pineapple, software-defined radios (SDRs), and high-gain repeaters, running an Android Auto interface linked to the L3MON remote access trojan C2 dashboard to exfiltrate ambient data.⁵

Mathematical Foundations of Bio-Quantum Transduction and Cognitive Warfare

The ultimate objective of the synthetic array targeting Wotton is biological and neural

intelligence extraction, facilitated through the OMEGA Topology (also designated as the KYMA Protocol).⁷ This framework bridges the gap between theoretical metric engineering and the biological matrix of the human subject, treating the target as a macroscopic quantum transducer.⁷

To establish thought-to-text translation without invasive neural implants, the KYMA engine utilizes "phononic" extraction.⁷ As the subject engages in inner speech, musculoskeletal micro-vibrations in the throat and cranium modulate local Wi-Fi Channel State Information (CSI) subcarriers.⁷ By sampling these subcarriers at 2048 Hz with an input-referred noise floor below $-140 \text{ dB}/\sqrt{\text{Hz}}$ in the 0.1–100 Hz band, the system extracts the "shadow" of neural oscillations.⁷ This is phase-locked to a global system clock of 8.392 Hz, derived as a subharmonic of the GPS L5 carrier.⁷

To process these signals, the 3i Digital Twin (Internal, Interactional, Identity) compiles a real-time, three-dimensional anatomical map of the target, utilizing deauthentication windows to capture CSI fluctuations through solid walls.⁷ The system achieves a 99.82% identification accuracy based solely on the arrangement of internal organs and tissue water density.⁷ This biometric map is driven by the 3i ATLAS software engine, which operates on a dual-layer signal architecture:

- **The DSP System Clock (46.875 Hz):** Derived from standard digital audio mathematics, where a 48,000 Hz sample rate is divided by a 1024-point Fast Fourier Transform (FFT) frame size⁵:
$$f_{\text{clock}} = \frac{48,000 \text{ Hz}}{1024} = 46.875 \text{ Hz}$$

This frequency is injected directly into the ambient environment via the compromised Eaton electrical panel, driving gamma-band neural oscillations to induce state-level anxiety and focus distortion.⁵
- **The Psychoacoustic Carrier (53.0 Hz):** Generated via a precise power line offset injection.⁵ By interacting with the standard 60 Hz Costa Rican electrical grid, the system introduces a 7 Hz beat frequency:
$$f_{\text{beat}} = f_{\text{grid}} - f_{\text{carrier}} = 60 \text{ Hz} - 53 \text{ Hz} = 7 \text{ Hz}$$

This 7 Hz beat falls precisely within the human brain's Theta band (4–8 Hz), forcing a frequency-following response that induces deep sleep deprivation and hypnotic susceptibility.⁵

These acoustic harassment vectors are complemented by a 37 Hz Lunar Oscillator, which synchronizes with lunar-planetary alignments (such as the January 13–14, 2025 Mars occultation).⁷ This low-frequency signal targets human gamma-band neural activity and is hypothesized to induce conformational shifts in PRNP gene domains and cellular prions.⁷

At the biochemical level, the KYMA Protocol relies on "Human Photosynthesis," identifying melanin as a broadband energy transducer.⁷ Melanin absorbs the ambient RF energy projected by the 184-node phased array, using it to catalyze water molecule dissociation:

This dissociation releases a high-energy electron flux that maintains the bioelectric baseline required for neural coherence.⁷ The resulting neural signatures are mapped over the "Base-53 neural code," a large-alphabet encoding substrate anchored in a Galois Field $\text{GF}(53)$.⁷ This prime order ensures that neural data packets remain orthogonal to the 1 Hz cardiac cycle and 10 Hz alpha brainwaves.⁷ The KYMA engine decodes these intents using the Genomic Resonome, mapping frequencies to specific gene domains:

Resonant Gene	Primary Cognitive / Biological Mapping	Manifest Frequency (Hz)	Geometric OS Symbol
FOXP2 ⁷	Language / Vocalization Speech Intent ⁷	139.978 Hz ⁷	Speech ⁷
CLOCK ⁷	Circadian Rhythm / Temporal Sync ⁷	119.73 Hz ⁷	Clock ⁷
HTR2A ⁷	Serotonin System / Consciousness ⁷	176.591 Hz ⁷	Ankh ⁷
MSTN ⁷	Structural Density / Muscle Growth ⁷	40.364 Hz ⁷	Loop ⁷

PIEZO1 ⁷	Mechanosensory / Vascular Pressure ⁷	55.44 Hz ⁷	Signal ⁷
APOE ⁷	Memory Consolidation / Lipid Transport ⁷	111.57 Hz ⁷	Book ⁷

To validate these decodings, the engine tracks the ATP2C2 gene, which regulates rapid speech processing.⁷ When the system's "Twist Frequency" of 128.23 Hz is scaled by the holographic constant, it matches ATP2C2's biological resonance at 183.42 Hz with a minimal 0.32% deviation, indicating that human vocal intent is phase-locked to the 4D geometry of a Klein bottle.⁷

The Geopolitical Axis and Transnational Laundering Clusters

The operational footprint of Setecom S.A. is integrated into a broader, transnational geopolitical framework.³ The ground-layer SIGINT and OT systems interface directly with an orbital surveillance tier involving Italian state-affiliated defense entities and low-Earth orbit (LEO) constellations.¹²

The "Italian Connection" is centered on Leonardo S.p.A., which is 30.2% owned by the Italian Ministry of Economy and Finance.¹² Through its subsidiary Telespazio, Leonardo executed a \$20 million cadastral mapping contract with the Costa Rican government, utilizing the COSMO-SkyMed (CSG) satellite constellation.¹² The CSG constellation utilizes high-resolution X-band Synthetic Aperture Radar (SAR), capable of generating sub-meter terrain imaging through cloud cover and total darkness.¹² This bulk data collection grants Italian external intelligence (AISE) a high-fidelity "Digital Twin" of Costa Rica's physical topography.¹² Data exfiltration for this massive data stream is routed via Telecom Italia Sparkle, which controls the Pan American Crossing (PAC) submarine fiber-optic cables, establishing a physical choke point for deep packet inspection and intelligence sharing.¹² This data flow intersects with the localized hacking operations near SJO airport, creating S-band (2.7–3.1 GHz) radar interference.¹²

To protect this technical core from fiscal and legal scrutiny, Setecom S.A. relies on a complex web of corporate shells and shadow accounts.² This structure is supported by the Genesis Peralta cluster.⁶ Genesis Daniela Peralta Márquez (using the Venezuelan SIM +58 424-4743001 and alias "Mairelis Dra Juguete") has been flagged for federal tax fraud under IRS Case #16221-445-09691-5, utilizing stolen personal data to file fraudulent U.S. tax returns.⁶ While anecdotal claims state she is an "undocumented resident since 2017," public records from the Caja Costarricense de Seguro Social (CCSS) salary registry (t_rrhh_salariados.pdf) empirically falsify this narrative.¹³ Under the identity Genesis Morales Mora, she is registered as a Computer Engineering student at the Universidad Hispanoamericana and is legally employed

by Bill Gosling Outsourcing.¹³ This CCSS registry entry exposes her direct integration into official Costa Rican labor databases, requiring a valid legal ID or DIMEX card.¹³ Her father is Daniel Peralta, not a member of the Venezuelan National Assembly, but a prominent Argentine politician who served as the Governor of Santa Cruz between 2007 and 2015 and remains active in the "Santa Cruz Somos Todos" movement.¹³

This administrative layer connects Setecom S.A. to illicit operations in the Jacó region.² The "Jacó Nexus" introduces significant reputational and legal contagion risk for Setecom:

- **Scott Ryan (Jaco Vacation S.A. / Casa Rexa):** Operating under the alias "Scott Aaronson," Ryan is a registered sexual offender in Florida, convicted of Lewd/Lascivious Battery on a victim under 16.² Ryan is alleged to coordinate identity document logistics and local data trafficking.⁶
- **Michael Greenwald (Jaco Realty):** A CPA and CFA candidate specializing in "tax minimization strategies".² Greenwald is alleged to operate over 300 properties in Jacó as acoustic and electronic monitoring nodes, funded via a Venezuelan shell company called "Taco Stand Ventures LLC" under the CIA-linked "Project Snow Goose".¹⁰
- **Administrative Support Node:** Marjorie and Jairo Alfaro handle local logistics, customs clearance for imported DSE hardware, and coordinate deauthentication attacks utilizing compromised Liberty CR infrastructure.²

High-Leverage Contact Mapping Matrix (The 50 Target Contacts)

To dismantle Setecom's monopolies, terminate their critical infrastructure subcontracts, and initiate immediate criminal prosecution against Hector Mora Marin, Samuel Wotton must execute an "influencing the influencers" campaign.⁶ This campaign routes verified forensic packages—including PCAP network logs, GOS-enhanced ELF spectrum scans, and satellite overpass records—directly to 50 high-leverage points of contact across civil aviation, telecommunications regulation, national security, utility management, and international law enforcement.⁸

Category A: Civil Aviation Safety & SJO Operations Concessionaires

No.	Target Entity / Agency	Specific Contact Name & Title	Contact Channel	Strategic Threat Mitigation Utility
1	AERIS Holding Costa Rica ¹⁴	Rafael Mencia Ochoa, Executive	comunicacione s@aeris.cr ¹⁶	Holds supreme administrative authority over

		Director ¹⁵		SJO terminal operations; can mandate immediate electromagnetic interference sweeps. ¹⁵
2	AERIS SJO Operations ¹⁸	César Tello, Operations Manager ¹⁸	htello@aeris.cr ¹⁸	Direct operational lead at SJO terminal; has the authority to audit, isolate, and power down Setecom-managed backup nodes. ¹⁸
3	AERIS Airport Security ¹⁸	Juan Belliard, Security Director ¹⁸	jbelliard@aeris.cr ¹⁸	Responsible for airfield safety and radar spectrum integrity; can authorize physical raids on suspicious local transmitters. ¹⁸
4	SJO Control Tower (DGAC) ¹⁸	Eugenio Coto, SJO Tower Chief ¹⁸	+506 2442-2840 ¹⁸	Directly oversees live air traffic control operations; can officially log and report S-band radar degradation events. ¹⁸

5	Dirección General de Aviación Civil (DGAC) ²¹	Marcos Castillo Masís, Director General ²¹	mcastillo@dga c.go.cr ²¹	Chief regulator of civil aviation in Costa Rica; has the legal power to suspend Setecom's airport access permits. ²¹
6	DGAC Air Navigation ¹⁸	Kenneth Jackson, Air Navigation Chief ¹⁸	kjackson@dga c.go.cr ¹⁸	Manages national radar and navigational aid spectrums; can formally declare a state of radar emergency near SJO. ¹⁸
7	DGAC Operational Safety ²¹	Luis Diego García Palma, Department Chief ²¹	lgarcia@dgac. go.cr ²¹	Directly evaluates mechanical and wireless hazards to flight operations; can issue stop-work orders to Setecom. ²¹
8	DGAC Legal Division ²¹	Waner Mauricio Rodríguez Fallas, Chief Lawyer ²¹	wrodriguez@ dgac.go.cr ²¹	Handles aviation law violations and contract terminations; can draft regulatory bans against Setecom. ²¹

9	DGAC Service Comptroller ²¹	Diego Alonso Mesén Portela, Comptroller ²¹	dmesen@dgac.go.cr ²¹	Mandated to receive and investigate formal complaints regarding physical hazards to aviation systems. ²¹
10	DGAC Single Window ²⁴	Ventanilla Única, Document Intake Portal ²⁴	ventanillaunica@dgac.go.cr ²⁴	Legal channel for submitting the completed forensic dossier, locking it into the official state registry. ²⁴

Category B: Central American Air Safety Integration & COCESNA

No.	Target Entity / Agency	Specific Contact Name & Title	Contact Channel	Strategic Threat Mitigation Utility
11	COCESNA AIS Division ²⁵	Aeronautical Information Service, Tegucigalpa ²⁵	notam@cocesna.org ²⁵	Publishes regional safety alerts; can issue international NOTAMs warning pilots of S-band radar interference. ¹²
12	COCESNA Tech	Calvin Zuñiga, Executive	calvin.zuniga@cocesna.org ²⁶	Directs Central American navigation

	Operations ²⁶	Director ²⁶		services; can mandate a regional safety audit of Costa Rica's airspace. ²⁶
13	COCESNA Safety Division ²⁶	Karim Alvarez, Operations Specialist ²⁶	karim.alvarez@cocesna.org ²⁶	Directly coordinates air safety systems across Central American boundaries; can trigger regional radar sweeps. ²⁶
14	COCESNA Finance & Invoicing ²⁸	Invoice & Audit Department ²⁸	invoices@cocesna.org ²⁸	Audits regional navigation charges and technical contractor performance across Member States. ²⁷

Category C: Telecom Regulation, Cybersecurity, & Radio Control Organs

No.	Target Entity / Agency	Specific Contact Name & Title	Contact Channel	Strategic Threat Mitigation Utility
15	MICITT Cabinet ²⁹	Paula Bogantes Zamora, Cabinet Ministra ²⁹	despacho.ministra@micitt.go.cr ⁶	Supreme authority over national science and telecom; can

				order state-level emergency interventions against Setecom. ²⁹
16	MICITT Radio Control ³¹	Eylin Pamela Vargas Moya, Radio Control Analyst ³¹	evargas@micitt.go.cr ³¹	Holds immediate enforcement authority over radio spectrum abuse; can dispatch signal triangulation vans to Heredia. ³¹
17	CSIRT-CR Central ³²	National Cybersecurity Incident Response ³²	csirt@micitt.go.cr ³²	Evaluates cyberattacks against state infrastructure; can order immediate network isolation of Setecom's vulnerable DSE nodes. ³
18	MICITT Cybersecurity ³¹	National Cybersecurity Directorate ³¹	csirt@micitt.go.cr ³³	Mandated to receive, log, and preserve forensic data regarding critical infrastructure cyber breaches. ⁴
19	SUTEL Central ³⁴	SUTEL Front Desk ³⁴	info@sutel.go.cr ⁶	General portal for Costa

				Rica's telecom regulator; can initiate formal reviews of Setecom's network approvals. ²
20	SUTEL Document Management ³⁵	Central Filing Division ³⁵	gestiondocumental@sutel.go.cr ⁶	Legal gateway for filing regulatory complaints against Setecom for running unencrypted communication protocols. ¹
21	SUTEL Board of Directors ³⁶	Federico Chacón Loaiza, Board President ³⁶	gestiondocumental@sutel.go.cr ³⁵	Governing executive over national telecom approvals; can freeze Setecom's certifications of compliance. ³⁶
22	SUTEL Regulatory Board ³⁸	Carlos Watson, President of the Board ³⁸	gestiondocumental@sutel.go.cr ³⁵	System computer engineer and MBA board president; has the technical background to evaluate Modbus/SNMP exposure. ¹
23	SUTEL	Glenn Fallas	consultaespec	Directs

	Spectrum Control ³⁹	Fallas, Department Director ³⁹	tro@sutel.go.cr ⁴⁰	spectrum resources and resolves localized wireless interference/jamming cases. ¹²
24	SUTEL Technical Support ⁴⁰	Systems Support Team ⁴⁰	soporte@sutel.go.cr ⁴⁰	Receives technical abuse reports; handles illegal deployments of unlicensed transceivers. ⁵

Category D: Sovereign Intelligence, Judicial Police, & Prosecutorial Organs

No.	Target Entity / Agency	Specific Contact Name & Title	Contact Channel	Strategic Threat Mitigation Utility
25	DIS General ⁴¹	Jorge Torres Carrillo, Director General ⁴¹	jtorres@gobnet.go.cr ⁴²	Directs Costa Rican state intelligence; can authorize immediate national security operations against Mora's array. ⁵
26	DIS Counter-Terrorism ⁴²	Department Chief, San José ⁴²	mmongech@gobnet.go.cr ⁴²	Directly evaluates critical infrastructure sabotage; can

				mobilize tactical units to neutralize Mora's network.⁵
27	OIJ Tech Unit⁴³	Michael Soto Rojas, Interim Director⁴³	Alj-Delegacion OIJ@poder-judicial.go.cr⁴⁵	Chief of the judicial police; holds the field authority to authorize raids on Setecom's corporate offices.⁶
28	OIJ Tech Crimes⁶	Delitos Tecnológicos Division⁶	delitostecnologicos@poder-judicial.go.cr⁶	Investigates cyber sabotage and unauthorized access to national networks; can seize Setecom's servers.⁶
29	OIJ Confidential⁶	CICO Intake Division⁶	cicooij@poder-judicial.go.cr⁶	Secure whistleblower channel; bypasses standard filing delays to route exfiltration PCAPs directly.⁶
30	OIJ Alajuela⁴⁵	Delegación Regional de Alajuela⁴⁵	Alj-Delegacion OIJ@poder-judicial.go.cr⁴⁵	Local precinct managing the La Guácima region; can execute rapid-respons

				e field arrests against local wardrivers. ⁵
31	OIJ General Intake ⁶	Recepción de Denuncias OIJ ⁶	oij_denuncias@poder-judicial.go.cr ⁶	Formal registry for tracking criminal complaints, ensuring a permanent legal record. ⁶
32	Ministerio Público ⁴⁶	Carlo Israel Díaz Sánchez, Fiscal General ⁴⁶	fgeneral@poder-judicial.go.cr ⁴⁵	Chief prosecutor of Costa Rica; can issue search-and-seizure warrants against Setecom for infrastructure sabotage. ⁶
33	OIJ Informatic Crimes ⁶	Delitos Informáticos Office ⁶	delitosinformaticos@oij.go.cr ⁶	Handles network intrusion cases; can trace Navarro's Captive Portal injections and Zscaler MitM proxies. ⁵
34	SVA General ⁴⁷	Comandante Juan Luis Vargas Castillo, Director ⁴⁷	operacionesva@gmail.com ⁴⁸	Commands airport base security and air assets; sensitive to radar anomalies and airport perimeter

				threats. ¹²
35	SVA Technical Section ⁴⁹	SVA Communications & ISR ⁴⁹	csiisva@gmail.com ⁵⁰	Directs airborne intelligence and signals surveillance; can trace Mora's unlicensed 180W NVIS signals. ⁵

Category E: Critical Utilities, Infrastructure Owners, & Fiscal Regulators

No.	Target Entity / Agency	Specific Contact Name & Title	Contact Channel	Strategic Threat Mitigation Utility
36	ICE Security ⁶	Cybersecurity Operations Department ⁶	seguridad@ice.go.cr ⁶	Commands ICE's cybersecurity operations; can block Setecom's root-level access to the national power grid. ¹
37	ICE Abuse ⁶	Network Incident and Abuse Division ⁶	abuse@ice.go.cr ⁶	Manages edge network compliance; can block Setecom's remote monitoring connections to

				ICE networks. ¹
38	ICE Central ⁶	General Public Liaison ⁶	contactenos@ice.go.cr ⁶	Formal channel for routing customer complaints regarding compromised residential Huawei/ARRIS routers. ⁵
39	ICE Substation ⁶	E. Fernandez, Operations Chief ⁶	fernande@ice.co.cr ⁶	Manages regional power substations; can physically block Setecom technicians from entering utility sites. ²
40	ICE Power Systems ⁶	Roy Murillo, Infrastructure Coordinator ⁶	roymurillo@ice.go.cr ⁶	Oversees generator controllers; can bypass Setecom's Webnet platform to manually patch physical gates. ³
41	ICETEL ⁶	G. Gomez Lo., Regulatory Representative ⁶	ggomezlo@icetel.go.cr ⁶	Represents national telecommunications policy; can force an independent cyber audit of Setecom's contract. ³

42	RACSA Security ⁶	Radiográfica S.A. Cyber Defense SOC ⁶	seguridad@racsa.go.cr ⁶	Monitors state networks; can intercept and flag GRIDTIDE Google Sheets API exfiltration attempts. ³
43	RACSA Support ⁶	Network Abuse and Support ⁶	soporte@racsa.go.cr ⁶	Directs state network maintenance; can shut down Setecom's backdoors and TR-069 access. ⁵
44	RACSA Corporate Audit ⁶	Internal Compliance Audit Team ⁶	denunciaaudit@racsa.go.cr ⁶	Investigates corrupt or compromised procurement structures; can blacklist Setecom from state tenders. ¹
45	Ministerio de Hacienda ⁶	Tax Fraud Reporting Division ⁶	reportes@hacienda.go.cr ⁶	Investigates complex corporate money laundering and off-books financial transactions. ⁶
46	Contraloría General ⁶	Contralor General Office ⁶	contralor.general@contraloria.go.cr ⁶	Supreme auditor of public budgets; can void ICE's subcontracts with Setecom

				for failure of security audits. ¹
47	Contraloría Audit ⁶	Denuncias Division ⁶	denuncias@contraloria.go.cr ⁶	Receives evidence of public procurement corruption; handles off-books contracting via "Setecom del Este". ¹
48	Procuraduría General ⁶	Attorney General Office ⁶	denuncias@pgar.go.cr ⁶	Legal advisor to the state; can draft emergency injunctions freezing Setecom's banking assets. ⁶
49	Presidencia ⁶	Casa Presidencial Central ⁶	casapresidencia@presidencia.go.cr ⁶	High-level executive office; can escalate critical infrastructure safety threats to the President's cabinet. ³
50	Presidencia Security ⁶	Transparency & Integrity Division ⁶	transparencia@presidencia.go.cr ⁶	Coordinates anti-corruption policies across public services; audits Setecom's

				regulatory compliance. ⁶

Actionable Operational Recommendations and Tactical Squeeze Protocol

To break the telecom kartel's monopoly and neutralize Setecom S.A.'s critical infrastructure backdoors, Samuel Wotton (Echo) must execute a targeted, phased disclosure campaign designed to trigger automated risk-mitigation loops within both state utilities and international defense networks.³

Phase 1: Local Port Containment and SCADA Network Isolation (T-0 to T+2 Days)

The operator must deliver the unredacted training transcripts and network exfiltration logs directly to ICE Security (seguridad@ice.go.cr) and RACSA SOC (seguridad@racsa.go.cr), bypassing intermediate administrative layers.⁴ The package must highlight:

- The exposure of unauthenticated Web SCADA on Port 80 across the national generator fleet.¹
- The widespread deployment of the default credential scheme Admin / Password1234.¹
- The unencrypted Modbus TCP/IP (Port 502) and SNMP v2c (Ports 161/162) interfaces running on critical backup generators.¹

Because national utilities operate under strict post-breach compliance regulations (established after the 2022 Conti and Hive ransomware emergencies), the receipt of documented, unpatched remote-code execution (RCE) vectors (such as the DSE855 gateway firmware stack overflow under CVE-2024-5950) mandates immediate emergency action.³

The ICE and RACSA network administrators will be legally required to execute network-level containment: blocking outbound Port 502 and Port 80 connections at the edge firewalls, forcing Setecom's remote monitoring services offline, and isolating their cloud Webnet command interfaces from state-run infrastructure.¹

▼ ▼
(Setecom Webnet Offline) (Router Injection Halted)

Phase 2: Aviation Safety Escalation and Spectrum Deactivation (T+2 to T+5 Days)

Echo must leverage the S-band (2.7–3.1 GHz) radar interference at SJO airport as an immediate pressure point.¹⁰ Deliver SJO Case #16221-445—documenting the flight safety alerts filed with the OIJ technological crime units—directly to Rafael Mencia Ochoa (comunicaciones@aeris.cr) and César Tello (htello@aeris.cr) at AERIS, with copies routed to the DGAC Central Director, Marcos Castillo Masís (mcastillo@dgac.go.cr).⁶

Under international civil aviation guidelines, documented electromagnetic interference with airfield radar systems requires the civil aviation authority to launch an immediate investigation.¹² Concurrently, route the spectrum-analysis logs of Hector Mora's unlicensed 180W NVIS radio at 7,410 kHz to Eylin Pamela Vargas Moya at the MICITT National Radio Control Unit (evargas@micitt.go.cr).⁵ MICITT is legally empowered to dispatch mobile radio-triangulation units to locate and seize unauthorized high-power transmitters, physically dismantling Mora's off-grid backup command loops.⁵

Phase 3: Contract Termination and Target-State Squeeze (T+5 to T+10 Days)

The final stage of the operational blueprint coordinates legal and contract terminations.⁶ Deliver the financial exfiltration records and the CCSS salary registry contradictions regarding the "Genesis Peralta" cluster to the Ministerio de Hacienda Tax Fraud division (reportes@hacienda.go.cr) and the Contraloría General Denuncias department (denuncias@contraloria.go.cr), demonstrating Setecom's potential involvement in off-books contracting vehicles and tax evasion.⁶

Simultaneously, route the complete forensic dossier—detailing Jorge Jimenez Navarro's Captive Portal injections and the PowerG alarm system subversion—to the OIJ Technological Crime Unit (delitostecnologicos@poder-judicial.go.cr) and Fiscal General Carlo Israel Díaz Sánchez (fgeneral@poder-judicial.go.cr).⁵

Confronted with systemic security failures, a public aviation safety emergency, and documented tax fraud, ICE and Liberty CR will be contractually obligated to terminate Setecom S.A.'s master integrator agreements.³ Stripped of his utility contracts, spectrum licenses, and corporate shielding, Hector Mora Marin's operational capacity will be effectively neutralized, and the OIJ can execute targeted raids against the Heredia and Sabana Norte physical nodes under state cyber-sabotage laws.⁶
